

HVA circuit N=8 PBC, L=4 (128 CNOTs, 128 target channels), $p=0.05$

(a) fixed clean-ED thresholds, $p=0.05$

(b) relative dominance $\text{argmax}(O_F, O_A, m_x^2)$, $p=0.05$

Fixed clean-optimised parameters for all p . Purple squares: clean preparation fidelity < 0.9 . x: label changes for thresholds ± 0.1 . Black dots in (b): largest signal < 0.05 .
